

2023 年数学(二) 真题解析

一、选择题

(1) 【答案】 (B).

【解】 由

$$\lim_{x \rightarrow \infty} \frac{y}{x} = 1, \lim_{x \rightarrow \infty} (y - x) = \lim_{x \rightarrow \infty} \frac{\ln\left(e + \frac{1}{x-1}\right) - 1}{\frac{1}{x}} = \lim_{x \rightarrow \infty} \frac{\ln\left[1 + \frac{1}{e(x-1)}\right]}{\frac{1}{x}} = \frac{1}{e}$$

得曲线的斜渐近线方程为 $y = x + \frac{1}{e}$, 应选(B).

(2) 【答案】 (D).

【解】 当 $x \leq 0$ 时,

$$F(x) = \int \frac{dx}{\sqrt{1+x^2}} = \ln(\sqrt{x^2+1} + x) + C_1;$$

当 $x > 0$ 时,

$$F(x) = \int (x+1)\cos x dx = (x+1)\sin x + \cos x + C_2,$$

因为 $F(x)$ 在 $x=0$ 处连续, 所以 $F(0-0) = F(0) = F(0+0)$, 取 $C_2 = 0$, 则 $C_1 = 1$, 故

$$F(x) = \begin{cases} \ln(\sqrt{x^2+1} + x) + 1, & x \leq 0, \\ (x+1)\sin x + \cos x, & x > 0, \end{cases}$$

选(D).

(3) 【答案】 (B).

【解】 由题意得 $x_n > 0$, 再由 $x_{n+1} = \sin x_n \leq x_n$ 得 $\{x_n\}$ 单调递减, 则 $\lim_{n \rightarrow \infty} x_n$ 存在,

令 $\lim_{n \rightarrow \infty} x_n = A$, 由 $A = \sin A$ 得 $A = 0$, 即 $\lim_{n \rightarrow \infty} x_n = 0$;

由 $0 < y_1 = \frac{1}{2} < 1$ 及 $y_{n+1} = y_n^2$ 得 $\{y_n\}$ 单调递减, 再由 $y_n > 0$ 得 $\lim_{n \rightarrow \infty} y_n$ 存在,

令 $\lim_{n \rightarrow \infty} y_n = B$, 由 $B = B^2$ 得 $B = 0$, 从而 $\lim_{n \rightarrow \infty} y_n = 0$;

令 $\lim_{n \rightarrow \infty} \frac{y_n}{x_n} = C$, 由 $\frac{y_{n+1}}{x_{n+1}} = \frac{y_n}{\sin x_n} \cdot y_n$ 得 $C = 0$, 应选(B).

(4) 【答案】 (C).

【解】 特征方程为 $\lambda^2 + a\lambda + b = 0$,

当 $\lambda_1 \neq \lambda_2$ 为实数时, 通解 $y = C_1 e^{\lambda_1 x} + C_2 e^{\lambda_2 x}$ 在 $(-\infty, +\infty)$ 上无界;

当 $\lambda_1 = \lambda_2$ 为实数时, 通解 $y = (C_1 + C_2 x) e^{\lambda_1 x}$ 在 $(-\infty, +\infty)$ 上无界;

当 $\lambda_{1,2} = \alpha \pm i\beta$ 且 $\alpha \neq 0$ 时, 通解 $y = e^{\alpha x} (C_1 \cos \beta x + C_2 \sin \beta x)$ 在 $(-\infty, +\infty)$ 上无界,

故 $\begin{cases} a=0, \\ a^2 - 4b < 0, \end{cases}$ 即 $a=0, b>0$, 应选(C).

(5) 【答案】 (C).

【解】 $t=0$ 时, $x=0, y=0$,

当 $t < 0$ 时, $x < 0$, 由 $\begin{cases} x=t, \\ y=-t \sin t, \end{cases}$ 得 $y = -x \sin x$;

当 $t \geq 0$ 时, $x \geq 0$, 由 $\begin{cases} x=3t, \\ y=t \sin t, \end{cases}$ 得 $y = \frac{x}{3} \sin \frac{x}{3}$, 即 $y = \begin{cases} -x \sin x, & x < 0, \\ \frac{x}{3} \sin \frac{x}{3}, & x \geq 0, \end{cases}$

由 $\lim_{x \rightarrow 0^-} \frac{y(x) - y(0)}{x} = \lim_{x \rightarrow 0^+} \frac{y(x) - y(0)}{x} = 0$ 得 $y'(0) = 0$;

当 $x < 0$ 时,

$$y' = -\sin x - x \cos x;$$

当 $x > 0$ 时,

$$y' = \frac{1}{3} \sin \frac{x}{3} + \frac{x}{9} \cos \frac{x}{3},$$

即

$$y' = \begin{cases} -\sin x - x \cos x, & x < 0, \\ \frac{1}{3} \sin \frac{x}{3} + \frac{x}{9} \cos \frac{x}{3}, & x \geq 0, \end{cases}$$

因为 $\lim_{x \rightarrow 0^-} y'(x) = \lim_{x \rightarrow 0^+} y'(x) = y'(0) = 0$, 所以 $y'(x)$ 在 $x=0$ 处连续;

因为

$$\lim_{x \rightarrow 0^-} \frac{y'(x) - y'(0)}{x} = -2 \neq \lim_{x \rightarrow 0^+} \frac{y'(x) - y'(0)}{x} = \frac{2}{9},$$

所以 $f''(0)$ 不存在, 选(C).

(6) 【答案】 (A).

【解】 $f(\alpha) = \int_2^{+\infty} \frac{dx}{x(\ln x)^{\alpha+1}} = \int_2^{+\infty} (\ln x)^{-\alpha-1} d(\ln x) = \int_{\ln 2}^{+\infty} x^{-\alpha-1} dx$
 $= -\frac{1}{\alpha} \cdot x^{-\alpha} \Big|_{\ln 2}^{+\infty} = \frac{(\ln 2)^{-\alpha}}{\alpha},$

由

$$f'(\alpha) = -(\ln 2)^{-\alpha} \cdot \ln(\ln 2) \cdot \frac{\alpha + \frac{1}{\ln(\ln 2)}}{\alpha^2} = 0$$

得 $\alpha_0 = -\frac{1}{\ln(\ln 2)}$, 选(A).

(7) 【答案】 (C).

【解】 $f'(x) = (x^2 + 2x + a)e^x$, 因为 $f(x)$ 没有极值点, 所以 $x^2 + 2x + a \geq 0$, 即 $\Delta = 4 - 4a \leq 0$, 即 $a \geq 1$;

$f''(x) = (x^2 + 4x + a + 2)e^x$, 因为曲线 $y = f(x)$ 有拐点, 所以 $16 - 4(a + 2) > 0$, 即 $a < 2$, 故 $1 \leq a < 2$, 选(C).

(8) 【答案】 (D).

【解】 $\begin{vmatrix} A & E \\ O & B \end{vmatrix} = |A| \cdot |B|$, 令

$$\begin{pmatrix} A & E \\ O & B \end{pmatrix}^{-1} = \begin{pmatrix} X_{11} & X_{12} \\ X_{21} & X_{22} \end{pmatrix},$$

由

$$\begin{pmatrix} A & E \\ O & B \end{pmatrix} \begin{pmatrix} X_{11} & X_{12} \\ X_{21} & X_{22} \end{pmatrix} = \begin{pmatrix} E & O \\ O & E \end{pmatrix}$$

$$\begin{cases} AX_{11} + EX_{21} = E, \\ AX_{12} + EX_{22} = O, \\ BX_{21} = O, \\ BX_{22} = E, \end{cases} \quad \text{解得} \quad \begin{cases} X_{11} = A^{-1}, \\ X_{12} = -A^{-1}B^{-1}, \\ X_{21} = O, \\ X_{22} = B^{-1}, \end{cases} \quad \text{则}$$

$$\begin{pmatrix} A & E \\ O & B \end{pmatrix}^* = |A| \cdot |B| \begin{pmatrix} A^{-1} & -A^{-1}B^{-1} \\ O & B^{-1} \end{pmatrix} = \begin{pmatrix} |B|A^* & -A^*B^* \\ O & |A|B^* \end{pmatrix},$$

选(D).

(9) 【答案】 (B).

【解】 $A = \begin{pmatrix} 2 & 1 & 1 \\ 1 & -3 & 4 \\ 1 & 4 & -3 \end{pmatrix}$, 由

$$|\lambda E - A| = \begin{vmatrix} \lambda - 2 & -1 & -1 \\ -1 & \lambda + 3 & -4 \\ -1 & -4 & \lambda + 3 \end{vmatrix} = \lambda(\lambda + 7)(\lambda - 3) = 0$$

得 $\lambda_1 = 3, \lambda_2 = -7, \lambda_3 = 0$, 故二次型的规范形为 $y_1^2 - y_2^2$, 选(B).

(10) 【答案】 (D).

【解】 令 $\gamma = k_1 \alpha_1 + k_2 \alpha_2 = -l_1 \beta_1 - l_2 \beta_2$, 或 $k_1 \alpha_1 + k_2 \alpha_2 + l_1 \beta_1 + l_2 \beta_2 = 0$,

由

$$\begin{pmatrix} 1 & 2 & 2 & 1 \\ 2 & 1 & 5 & 0 \\ 3 & 1 & 9 & 1 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 2 & 2 & 1 \\ 0 & -3 & 1 & -2 \\ 0 & 1 & -1 & 0 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & 0 & -3 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 \end{pmatrix}$$
$$\text{得} \begin{pmatrix} k_1 \\ k_2 \\ l_1 \\ l_2 \end{pmatrix} = k \begin{pmatrix} 3 \\ -1 \\ -1 \\ 1 \end{pmatrix} = \begin{pmatrix} 3k \\ -k \\ -k \\ k \end{pmatrix}, \text{故}$$

$$\gamma = 3k\alpha_1 - k\alpha_2 = k\beta_1 - k\beta_2 = 3k \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} - k \begin{pmatrix} 2 \\ 1 \\ 1 \end{pmatrix} = k \begin{pmatrix} 1 \\ 5 \\ 8 \end{pmatrix} (k \in \mathbf{R}),$$

选(D).

二、填空题

(11) 【答案】 -2 .

【解】 由 $\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} + o(x^3)$ 得

$$f(x) = (a+1)x + \left(b - \frac{1}{2}\right)x^2 + \frac{x^3}{3} + o(x^3);$$

由 $e^{x^2} = 1 + x^2 + o(x^3)$, $\cos x = 1 - \frac{x^2}{2} + o(x^3)$ 得 $g(x) = \frac{3}{2}x^2 + o(x^3)$,

再由 $f(x) \sim g(x)$ 得 $a = -1, b - \frac{1}{2} = \frac{3}{2}$, 即 $a = -1, b = 2$, 故 $ab = -2$.

(12) 【答案】 $\frac{4\pi}{3} + \sqrt{3}$.

【解】 显然 $x \in [-\sqrt{3}, \sqrt{3}]$, 曲线段的长度为

$$\begin{aligned} l &= \int_{-\sqrt{3}}^{\sqrt{3}} \sqrt{1+y'^2} dx = \int_{-\sqrt{3}}^{\sqrt{3}} \sqrt{4-x^2} dx \stackrel{x=2\sin t}{=} 2 \int_0^{\frac{\pi}{3}} 4\cos^2 t dt \\ &= 4 \int_0^{\frac{\pi}{3}} (1 + \cos 2t) dt = \frac{4\pi}{3} + 2 \cdot \frac{\sqrt{3}}{2} = \frac{4\pi}{3} + \sqrt{3}. \end{aligned}$$

(13) 【答案】 $-\frac{3}{2}$.

【解】 当 $x=1, y=1$ 得 $z=0$, $e^z + xz = 2x - y$ 两边对 x 求偏导得

$$e^z \cdot \frac{\partial z}{\partial x} + z + x \frac{\partial z}{\partial x} = 2,$$

代入得 $\frac{\partial z}{\partial x} \Big|_{(1,1)} = 1$;

$e^z \cdot \frac{\partial z}{\partial x} + z + x \frac{\partial z}{\partial x} = 2$ 两边对 x 求导得

$$e^z \cdot \left(\frac{\partial z}{\partial x}\right)^2 + e^z \cdot \frac{\partial^2 z}{\partial x^2} + 2 \frac{\partial z}{\partial x} + x \frac{\partial^2 z}{\partial x^2} = 0,$$

代入得 $\frac{\partial^2 z}{\partial x^2} \Big|_{(1,1)} = -\frac{3}{2}$.

(14) 【答案】 $-\frac{11}{9}$.

【解】 $x=1$ 代入得 $y=1, 3x^3=y^5+2y^3$ 两边对 x 求导得

$$9x^2 = (5y^4 + 6y^2) \frac{dy}{dx},$$

代入得 $\frac{dy}{dx} \Big|_{x=1} = \frac{9}{11}$, 故曲线在 $x=1$ 对应点处的法线斜率为 $-\frac{11}{9}$.

(15) 【答案】 $\frac{1}{2}$.

【解】 由 $f(x+2) - f(x) = x$ 得 $f(x+2) = f(x) + x$, 则

$$\begin{aligned} \int_1^3 f(x) dx &= \int_1^0 f(x) dx + \int_0^2 f(x) dx + \int_2^3 f(x) dx \\ &= -\int_0^1 f(x) dx + \int_2^3 f(x) dx = -\int_0^1 f(x) dx + \int_0^1 f(x+2) dx \\ &= -\int_0^1 f(x) dx + \int_0^1 f(x) dx + \int_0^1 x dx = \frac{1}{2}. \end{aligned}$$

(16) 【答案】 8.

【解】 $\bar{A} = \begin{pmatrix} a & 0 & 1 & 1 \\ 1 & a & 1 & 0 \\ 1 & 2 & a & 0 \\ a & b & 0 & 2 \end{pmatrix}$, 因为原方程组有解, 所以 $r(A) = r(\bar{A}) \leq 3 < 4$,

从而 $|\bar{A}| = 0$,

由

$$|\bar{A}| = \begin{vmatrix} a & 0 & 1 & 1 \\ 1 & a & 1 & 0 \\ 1 & 2 & a & 0 \\ a & b & 0 & 2 \end{vmatrix} = - \begin{vmatrix} 1 & a & 1 \\ 1 & 2 & a \\ a & b & 0 \end{vmatrix} + 2 \begin{vmatrix} a & 0 & 1 \\ 1 & a & 1 \\ 1 & 2 & a \end{vmatrix} = 8 - \begin{vmatrix} 1 & a & 1 \\ 1 & 2 & a \\ a & b & 0 \end{vmatrix} = 0$$

得 $\begin{vmatrix} 1 & a & 1 \\ 1 & 2 & a \\ a & b & 0 \end{vmatrix} = 8$.

三、解答题

(17) 【解】 (1) 切线方程为 $Y - y = y'(X - x)$, 在 y 轴上的截距为 $Y = y - xy'$, 由题意得

$y - xy' = x$, 整理得 $y' - \frac{1}{x}y = -1$, 解得

$$y = \left[\int (-1)e^{\int -\frac{1}{x}dx} dx + C \right] e^{-\int -\frac{1}{x}dx} = (C - \ln x)x,$$

当 $x = e^2$ 时, $y = 0$, 则 $C = 2$, 即 $y(x) = (2 - \ln x)x$.

(2) 设 $M(x, (2 - \ln x)x) \in L$, $y'(x) = 1 - \ln x$, M 点处的切线方程为

$$Y - (2 - \ln x)x = (1 - \ln x)(X - x),$$

令 $Y = 0$ 得 $X = x - \frac{(2 - \ln x)x}{1 - \ln x} = \frac{x}{\ln x - 1}$; 令 $X = 0$ 得 $Y = x$,

所围成的三角形的面积为 $S(x) = \frac{1}{2} \cdot \frac{x^2}{\ln x - 1}$, 令 $S'(x) = \frac{1}{2} \cdot \frac{x(2\ln x - 3)}{(\ln x - 1)^2} = 0$ 得 $x = e^{\frac{3}{2}}$,

当 $e < x < e^{\frac{3}{2}}$ 时, $S'(x) < 0$; 当 $x > e^{\frac{3}{2}}$ 时, $S'(x) > 0$.

故 $x = e^{\frac{3}{2}}$ 时, 三角形面积最小, 最小面积为 $S(e^{\frac{3}{2}}) = e^3$.

(18) 【解】 由 $\begin{cases} \frac{\partial f}{\partial x} = e^{\cos y} + x = 0, \\ \frac{\partial f}{\partial y} = -xe^{\cos y} \sin y = 0, \end{cases}$ 得

$$\begin{cases} x = -e^{-1}, \\ y = (2k+1)\pi \end{cases} \text{ 及 } \begin{cases} x = -e, \\ y = 2k\pi, \end{cases} k \in \mathbf{Z},$$

$$\frac{\partial^2 f}{\partial x^2} = 1, \frac{\partial^2 f}{\partial x \partial y} = -e^{\cos y} \cdot \sin y, \frac{\partial^2 f}{\partial y^2} = xe^{\cos y} \cdot \sin^2 y - xe^{\cos y} \cdot \cos y,$$

当 $(x, y) = (-e^{-1}, (2k+1)\pi)$ 时, $A = 1, B = 0, C = -e^{-2}$,

因为 $AC - B^2 < 0$, 所以 $(x, y) = (-e^{-1}, (2k+1)\pi)$ 不是极值点;

当 $(x, y) = (-e, 2k\pi)$ 时, $A = 1, B = 0, C = e^2$,

因为 $AC - B^2 > 0$ 且 $A > 0$, 所以 $(x, y) = (-e, 2k\pi) (k \in \mathbf{Z})$ 为函数的极小值点, 极小

值为 $f(-e, 2k\pi) = -\frac{e^2}{2}$.

(19) 【解】 (1) D 的面积为

$$\begin{aligned} A &= \int_1^{+\infty} \frac{dx}{x\sqrt{1+x^2}} \stackrel{x=\tan t}{=} \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \frac{\sec^2 t}{\sec t \tan t} dt = \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \csc t dt \\ &= \ln |\csc t - \cot t| \Big|_{\frac{\pi}{4}}^{\frac{\pi}{2}} = -\ln(\sqrt{2} - 1) = \ln(1 + \sqrt{2}). \end{aligned}$$

(2) D 绕 x 轴旋转所成的旋转体的体积为

$$V = \pi \int_1^{+\infty} \frac{dx}{x^2(1+x^2)} = \pi \int_1^{+\infty} \left(\frac{1}{x^2} - \frac{1}{1+x^2} \right) dx = \pi \left(1 - \arctan x \Big|_1^{+\infty} \right) = \pi \left(1 - \frac{\pi}{4} \right).$$

(20) 【解】 如图所示, 令

20 题图

$$\begin{cases} x = r \cos \theta, \\ y = r \sin \theta \end{cases} \left(0 \leq \theta \leq \frac{\pi}{3}, \frac{1}{\sqrt{1 - \sin \theta \cos \theta}} \leq r \leq \frac{\sqrt{2}}{\sqrt{1 - \sin \theta \cos \theta}} \right), \text{ 则}$$

$$\begin{aligned} I &= \iint_D \frac{dx dy}{3x^2 + y^2} = \int_0^{\frac{\pi}{3}} \frac{d\theta}{3\cos^2\theta + \sin^2\theta} \int_{\frac{1}{\sqrt{1 - \sin \theta \cos \theta}}}^{\frac{\sqrt{2}}{\sqrt{1 - \sin \theta \cos \theta}}} \frac{dr}{r} = \ln \sqrt{2} \int_0^{\frac{\pi}{3}} \frac{d\theta}{3\cos^2\theta + \sin^2\theta} \\ &= \ln \sqrt{2} \int_0^{\frac{\pi}{3}} \frac{d(\tan \theta)}{3 + \tan^2\theta} = \frac{\ln \sqrt{2}}{\sqrt{3}} \arctan \frac{\tan \theta}{\sqrt{3}} \Big|_0^{\frac{\pi}{3}} = \frac{\pi \ln \sqrt{2}}{4\sqrt{3}}. \end{aligned}$$

(21) 【证明】 (1) 由泰勒公式得

$$f(a) = f'(0)a + \frac{f''(\xi_1)}{2!}a^2, \text{ 其中 } 0 < \xi_1 < a,$$

$$f(-a) = -f'(0)a + \frac{f''(\xi_2)}{2!}a^2, \text{ 其中 } -a < \xi_2 < 0,$$

相加得 $\frac{f''(\xi_1) + f''(\xi_2)}{2} = \frac{1}{a^2}[f(a) + f(-a)]$, 因为 $f''(x) \in C[\xi_2, \xi_1]$, 所以 $f''(x)$ 在 $[\xi_2, \xi_1]$ 上存在最小值 m 和最大值 M ,

因为 $m \leq \frac{f''(\xi_1) + f''(\xi_2)}{2} \leq M$, 所以存在 $\xi \in [\xi_2, \xi_1] \subset (-a, a)$, 使得

$$f''(\xi) = \frac{f''(\xi_1) + f''(\xi_2)}{2}, \text{ 故}$$

$$f''(\xi) = \frac{1}{a^2}[f(a) + f(-a)].$$

(2) 不妨设 $c \in (-a, a)$ 为极值点, 则 $f'(c) = 0$, 由泰勒公式得

$$f(a) = f(c) + \frac{f''(\eta_1)}{2!}(a-c)^2, c < \eta_1 < a,$$

$$f(-a) = f(c) + \frac{f''(\eta_2)}{2!}(-a-c)^2, -a < \eta_2 < c,$$

两式相减得

$$\text{得 } \alpha_1 = \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix};$$

由

$$\mathbf{E} + \mathbf{A} = \begin{pmatrix} 2 & 1 & 1 \\ 2 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\text{得 } \alpha_2 = \begin{pmatrix} -1 \\ 0 \\ 2 \end{pmatrix};$$

由

$$2\mathbf{E} - \mathbf{A} = \begin{pmatrix} 1 & -1 & -1 \\ -2 & 3 & -1 \\ 0 & -1 & 3 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & -4 \\ 0 & 1 & -3 \\ 0 & 0 & 0 \end{pmatrix}$$

$$\text{得 } \alpha_3 = \begin{pmatrix} 4 \\ 3 \\ 1 \end{pmatrix},$$

$$\text{令 } \mathbf{P} = \begin{pmatrix} 0 & -1 & 4 \\ -1 & 0 & 3 \\ 1 & 2 & 1 \end{pmatrix}, \mathbf{A} = \begin{pmatrix} -2 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 2 \end{pmatrix}, \text{则 } \mathbf{P}^{-1}\mathbf{A}\mathbf{P} = \mathbf{A}.$$

$$f(a) - f(-a) = \frac{(a-c)^2}{2} f''(\eta_1) - \frac{(a+c)^2}{2} f''(\eta_2),$$

令 $|f''(\eta)| = \max\{|f''(\eta_1)|, |f''(\eta_2)|\}$, 则

$$|f(a) - f(-a)| \leq \frac{(a-c)^2 + (a+c)^2}{2} |f''(\eta)|,$$

$$\text{或 } |f''(\eta)| \geq \frac{|f(a) - f(-a)|}{\frac{(a-c)^2 + (a+c)^2}{2}},$$

令 $\varphi(x) = \frac{(a-x)^2 + (a+x)^2}{2}$, 由 $\varphi'(x) = 0$ 得 $x = 0$,

再由 $\varphi(a) = \varphi(-a) = 2a^2$, $\varphi(0) = a^2$ 得 $\max_{-a \leq x \leq a} \varphi(x) = 2a^2$, 故

$$|f''(\eta)| \geq \frac{1}{2a^2} |f(a) - f(-a)|.$$

(22) 【解】 (1) $\mathbf{A} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} x_1 + x_2 + x_3 \\ 2x_1 - x_2 + x_3 \\ x_2 - x_3 \end{pmatrix}$ 写成

$$\mathbf{A} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix},$$

因为对任意的 x_1, x_2, x_3 都成立, 所以有

$$\mathbf{A} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \mathbf{A} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}, \mathbf{A} \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix} \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix},$$

$$\text{于是有 } \mathbf{A} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}, \text{ 故 } \mathbf{A} = \begin{pmatrix} 1 & 1 & 1 \\ 2 & -1 & 1 \\ 0 & 1 & -1 \end{pmatrix}.$$

(2) 由

$$|\lambda \mathbf{E} - \mathbf{A}| = \begin{vmatrix} \lambda - 1 & -1 & -1 \\ -2 & \lambda + 1 & -1 \\ 0 & -1 & \lambda + 1 \end{vmatrix} = (\lambda + 2)(\lambda + 1)(\lambda - 2) = 0$$

得 $\lambda_1 = -2, \lambda_2 = -1, \lambda_3 = 2$;

由

$$2\mathbf{E} + \mathbf{A} = \begin{pmatrix} 3 & 1 & 1 \\ 2 & 1 & 1 \\ 0 & 1 & 1 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$
